

# LECO – MOLE PROTECTION

... the animal friendly alternative!

Protect your lawns from bothersome molehills with the **LECO - Mole Protection Fabric!**

Our specially designed fabric is both durable and easy to install. Not only does it serve as a dependable barrier to prevent moles from disturbing your lawn and creating unsightly mounds, but it also stabilises and reinforces the soil by intertwining with the turf layer.

The mole protection fabric is made from robust PE, which withstands all weather conditions and offers a long-term solution for a mole-free garden, with the added benefit of being harmless to the animals.

## YOUR BENEFITS

- No use of chemicals or sound waves
- High quality „Made in Germany“
- Easy to install
- Additional soil stabilisation
- A beautiful garden with a clear conscience

NO HARMFULL USE OF  
CHEMICALS OR SOUND WAVES!

## For a beautiful garden and a clear conscience!

As endearing as these little critters may be, the earth mounds they leave behind on otherwise pristine lawns are quite an eyesore for garden owners.

Since moles are a protected species, they must not be hunted, captured, or, even worse, killed. To maintain a beautiful garden without causing harm to these animals through poisons or traps, we recommend our **LECO - Mole Protection Fabric**.

## INSTALLATION

### Horizontal Installation

Horizontal installation is the standard procedure when laying the fabric beneath rolled turf or reseeding lawns. In this method, the mole protection fabric is spread evenly across the ground.

When laying the sheets side-by-side, an overlap of 25 cm should be maintained.

### Vertical Installation

Vertical installation is recommended as an additional or standalone measure around the entire property to prevent moles from migrating in from neighbouring areas. The fabric should be installed vertically at a depth of at least 50 cm.

With this method as well, an overlap of 25 cm should be ensured when placing the sheets.
